OBSIDIAN

Secure your browser-based workplace

Get real-time visibility and control over SaaS and AI usage across your organization, plus immediate protection from phishing kits bypassing email defenses.

IDENTITY THREAT PREVENTION

Traditional security solutions fail to protect your employees where they spend most of their time—the browser. This gap makes it hard to see every SaaS and AI app users are accessing.

Without real-time visibility in the browser, security teams struggle to stop data loss to GenAI and unauthorized applications, or prevent users from submitting SaaS credentials on fake sites.

7	Shadow SaaS and GenAI apps for every 1 governed app[1]
1 IN 2	Enterprises interact with at least 1 shadow AI app[1]
39%	of SaaS data breaches start with AiTM[1]
39K	Daily AiTM attacks[2]

Stop data loss to GenAI apps

Generative AI is reshaping how data leaves your organization. Everyday, employees expose corporate data to AI chatbots, browser plugins, and applications without oversight. This introduces new avenues for data leaks, insider threats, and compliance violations.

With Obsidian, security teams enable the safe and responsible adoption of new AI tools.

Discover

Track utilization for every GenAI app, browser extension, and hidden app-to-app integration for full visibility into LLMs training on your company data

Manage

Understand and manage users, activity, and risks in one unified view for evidence to enforce acceptable use policies.

Govern

Stop sensitive data from leaving your organization with flexible policies to warn, redact, or prohibit prompts with restricted information

> **"With the Obsidian Browser Extension, we've got a lot of insight into how users are interacting with things like generative AI SaaS solutions."**

> Chief Information Security Officer, Snowflake

Monitor shadow SaaS apps in real-time

SaaS adoption is accelerating across teams, but most usage isn't known. With 78% of SaaS apps operating outside of IT's visibility—and many handling sensitive data—shadow SaaS introduces unmanaged data risk and redundant spend.

Automatically discover, monitor, and control access to every application employees use.
In real time.

- Inventory your SaaS estate with automatic discovery of SaaS and AI applications
- Assess business need and risk, analyzing usage activity at the application level
- Control data exposure and unwanted app spend
- Proactively block access to high-risk SaaS and GenAI apps

Prevent identity threats and SaaS credential theft in the browser

Email security and MFA can't protect against modern phishing kits that target unsecured personal inboxes, or deploy adversary-in-the-middle (AiTM) techniques. In fact, 93% of phishing compromises we detected were not caught by email security. Once users interact with these malicious links, false login pages convince them to authenticate using their SaaS credentials and steal their tokens. Stopping these attacks requires security in the browser.

SOURCES [1] Obsidian Security [2] Microsoft

Obsidian makes the users' browsers security-aware by analyzing website legitimacy in real-time to prevent attackers from stealing SaaS credentials.

- Detect, warn, or block users from submitting credentials on malicious websites
- Customize preferred warning message
- Robust triage capabilities include alert information and user actions, including remediation steps
- Stay ahead of emerging web threats with out-of-the-box preventions informed by real-world breach insights

Secure, high performance, and private

Local analysis
Everything is done locally in your browser, guaranteeing privacy and fast performance

Private by design
Only observes corporate logins and does not collect passwords or personal browsing information

Flexible, fast deployment
Deploy in minutes across all major browsers including enterprise browsers like Chrome, Firefox, Edge, and Island to instantly protect your SaaS credentials

Easy management
Automated protection on day one, no ongoing tooling or configuration

Trusted protection
Leading Fortune 1000 and Global 2000 enterprises trust Obsidian to secure 49M identities and 1.5M browsers

Visit our website to learn how the Obsidian Security Browser Extension adds a needed last last line of defense to ensure your users safely interact with SaaS and AI on the internet.
